The present sequence is that of Protide-1 (PT-1), a peptide antibiotide with distinct effector and activator domains. PT-1 contains a C-terminal antimicrobial peptide effector (RP-1), an N-terminal chemokine-like peptide effector (interleukin-8 domain) and an activator site specific distinct effectors in the presence of the processe. PT-1 was designed to be cleaved into 2 distinct effectors in the presence of v8 protease. In particular, it was designed to exert antimicrobial activity less than that of RP-1 in the absence of v8 protease, but equivalent to or exceeding that of RP-1 in the absence of v8 protease produced by Staphylococcus aureus. Thus, PT-1 was designed to exert optimal antimicrobial activity in the context of infections due to staphylococcal cells elaborating the virulence factor v8 protease. PT-1 was synthesised by Staphylococcus aureus of an example of context-activated procides of the invention that have 2 or more effectors with individual distinct biological functions and one or more effectors upon context activation. The biological function of one or more effectors upon context activation. The proteins and therapy of a broad

```
The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acid corre sequence (derived from PMP-1 and PMP-2, platelet microbical protein), and recromers. PMP-1 and PMP-2, platelet microbical protein), and recromers. PMP-1 and PMP-2, platelet microbical protein), and recromers. The possible structures are fully described in the specification. Also included are (1) an antimicrobial agents active against organisms such as corresponding comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents that enhance the antimicrobial agents that enhance in combination with other specifically against bacteria and fungi, agents in combination with other conventional antimicrobials, agents that enhance the antimicrobial for conventional antimicrobials, agents to improve efficiency of molecular (conventions of leukocytes, as disinfectants or preservatives for use in the foods and cosmetics and as agents to improve efficiency of molecular considered to have undesirable toxicity, immunogenicity and short to biology techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short are based upon natural antimicrobial peptides of prior art have generally become problems of toxicity immunogenicity, and shortness of defectiveness due to biodegradation, retaining activity in plasma and conversion problems of toxicity, immunogenicity, and shortness of effectiveness due to biodegradation, retaining activity in plasma and conversion problems of toxicity in plasma and antimicrobial peptides and antimicrobial peptides and antimicrobial peptides and antimicrobial peptides of the present sequence is a rabbit pwp based antim
                                                                                                                                              New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ouery Match 67.4%; Score 64; DB 5; Length 35; Best Local Similarity 76.5%; Pred. The present sequence is that of Protide-2 (PT-2), a peptide antibiotide with distinct effector and activator domains. PT-2 contains a C-terminal cantimicrobial peptide effector (RP-1), an N-terminal chemokine-like peptide effector (interleukin-8 domain) and an activator site specific for C3 convertase, a complement fixing procease. PT-2 is cleaved into 2 distinct effectors in the presence of C3 convertase. In particular, it was designed to exert antimicrobial activity less than that of RP-1 in the presence of C3 convertase. Thus, PT-2 was designed to exert in the presence of C3 convertase. Thus, PT-2 was designed to exert in the presence of C3 convertase. Thus, PT-2 was designed to exert in the presence of C3 convertase. Thus, PT-2 was designed to exert in the presence of C3 convertase. Thus, PT-2 was designed to exert in the presence of C3 convertase. Thus, PT-2 was designed to exert in the presence of C3 convertase. Thus, PT-2 was designed to exert in the presence of C3 convertase. Thus, PT-2 was designed to exert in the presence of C3 convertase. Thus, PT-2 was designed to exert in the presence of C3 convertase. Thus, PT-2 was designed to exert in the presence of C3 convertase. Thus, PT-2 was designed to exert in the presence of C3 convertase. Thus, PT-2 was designed to exert of the innate immune response to antigen exposure. PT-2 is an example of context-activated protides of the invention that have 2 or more effectors with individual distinct biological functions and one or more corresponding activator sites that can each initiate or amplify the biological function of one or more effectors upon context activation. The prove corresponding activator sites that can each initiate or amplify the protein an each in the work of a broad and one or more effectors upon context activation. The present sequence is that of Protide-4 (PT-4), a peptide antibiotide with distinct effector and activator domains. PT-4 contains a C-terminal antimicrobial peptide effector (RP-1), an N-terminal chemokina-like antimicrobial peptide effector (RP-1), an N-terminal chemokina-like peptide effector (interleukin-8 domain) and an activator site specific for matrix metalloproteinase MMP-9, which is produced to dissolve the crissue in front of the growing blood vessel tip to allow for its continued tissue invasion. PT-4 was designed to be cleaved into 2 distinct effectors in the presence of MMP-9. In particular, PT-4 exerts artineoplastic and/or antimicrobial activity less than that of RP-1 in the presence of MMP-9, but equivalent to or exceeding that of RP-1 in the presence of MMP-9. Thus, PT-4 exerts optimal antimoplastic and/or antimicrobial activity in the context of new blood vessel formation. PT-4 is an example of context-activated protides of the invention that have 2 or more effectors with individual distinct biological functions and one corresponding activator sites that can each initiate or amplify the protides are useful in the disagnosis, prophylaxis and therapy of a broad range of pathological conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2;
bacterial infection; fungal infection; fungicide; disinfectant;

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-
150 amino acide containing a 7-13 amino acide fore sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The PMP-1 and PMP-2 platelet microbial peptide composition for direct activity or for potentiating antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and funsions; and (2) antimicrobial peptides for potentiating antimicrobial agents, extensions such as absceria and fungi. The entimicrobial peptides are useful as individual antimicrobial agents (antimicrobial peptides are useful as individual antimicrobial agents (antimicrobial peptides are useful as individual antimicrobial peptides are useful as individual antimicrobial peptides of conventional antimicrobials, agents that enhance the antimicrobial for antimicrobial agents that enhance the antimicrobial peptides of foods and cosmetics and as agents to improve efficiency of foods and cosmetics and as agents to improve efficiency of molecular of foods and cosmetics and as agents to improve efficiency of molecular considered to have undesirable toxicity, immunogenicity and short are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic creststance They exhibit lower inherent mammalian cell toxicity and shortness of defectiveness due to biodegradation, relatining activity in plasma and companients.

The present sequence is a rabbit pMP based antimicrobial peptides
                                                                              New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit;

```
The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acid a containing a 7-13 amino acid acore sequence (dearload from 150 amino acid a containing a 7-13 amino acid a core sequence (dearload from PWP-1 and PWP-2, platelet microbicial protein), and retromers.

Truncations, extensions, combinations, fusions and their derivatives. The consible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of attimicrobial peptides are useful as individual antimicrobial agents.

Colessor and activity of a sequence sequence sequence sequence are and fungi, agents in combination with other antimicrobial peptides are useful as individual antimicrobial agents.

Conventional antimicrobials, agents that enhance the antimicrobial are conventional antimicrobials, agents to improve efficiency of functions of leukocytes, as disinfectants or preservatives for use in the foods and cosmetics and as agents to improve efficiency of molecular considered to have undesirable toxicity, immunogenicity and short or are based upon natural antimicrobial peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicity and shortness of testitance or resistance is a rabbit pwp based antimicrobial peptides or effectiveness and event and an administration, retaining activity in plasma and companience is a rabbit pwp antimicrobial peptides.
                                                                                                                                                       New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antimicrobial; metapeptide; PMP-2; platelet microbicidal protein; antibiotic; infection; fungal; bacterial; neutrophil; apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Match 67.4%; Score 64; DB 5; Length 40; Local Similarity 76.5%; Pred.                                                                                                                                                                          activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZENENE and its derivatives selected from XENEXZENENE and its derivatives selected from the group consisting of XBENENE, BXZXXXB, XBEXZENEN and BEXZBENZ; and (b) a second peptide template XBENZXENEN, XBENZXENEN, BYENZXENEN, and Capture or SERENCE, where B = at least one positively charged amino acid; at least one non-polar hydrophobic amino acid; at least one aromatic amino acid, and where B, X and Z may be separated by one or more other amino acid, and where B, X and Z may be separated by one or more other infections. The peptides can be used to treat bacterial and fungal neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. ANYS7463 to ANYS7557 represent sequences

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXENS and its derivatives selected from XZBBZNSARS, BXXZXB, XBBXZNSB and its derivatives as escond peptide template XBBX MAXZB, XBBXZNSB, and (b) group consisting of XBBXBBX; XBBXXBBX, BXXBXXB, XBBZXBB, and XBBZXBBX; where B = at least one positively charged amino acid; x = at least one non-polar hydrosphobic amino acid; Z = at least one aromatic amino acid, and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. ANSTAST represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of :
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gapa
Antimicrobial peptides for potentiating antimicrobial agents active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Rabbit platelet microbicidal protein, PMP-2, based peptide #40.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   63.2%; Score 60; DB 2; Length 18; 70.6%; Pred. EVER 150 amino acids containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity of included are (1) an antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-4 containing an amino acid core sequence selected from truncations of the peptides described above, antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents, agents that enhance the antimicrobial agents that enhance the antimicrobial supprise against bacteria and fungi, agents in combination with other antimicrobials, agents that enhance the antimicrobial functions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic are based upon natural antimicrobial peptides of effectiveness of duration of effectiveness due to biodegradation, retaining activity in plasma and covercome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and covercome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and covercome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit;

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBXB and its derivatives selected from XZBBZBXBXB, BXZXXB, XBBXZXBBX and BRXZBBXZ; and (b) a second peptide template XBBXXXB, XBBXXXBB, and selected from the group consisting of XBBXBBX, XBBXXXBX, BXXBXX, XBBXXXBB, and Consisting of XBBXBBX, XBBXXXBX, BXXBXXB, AZBBXXB, and consisting of XBBXBBX, XBBXXXB, BXXBXXB, AZBBXXBB, and consisting of XBBZABBX, XBBXXXB, BXXBXXB, and consisting of XBBZBBX and their derivatives consisting and morpholar hydrophobic amino acid, z at least one morpopholar hydrophobic amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAX57463 to AAX57757 represent sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2;

EXPRINGE THE STATE OF THE PROPERTY OF THE PROPERTY OF THE PROPERTY OF TRUNCATIONS, CANDIDATIONS, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or included are (1) an antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide composition for direct activity or retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations and fungions; and (2) antimicrobial peptides for potentiating antimicrobial activity of leukocytes against organisms such as bacteria and fungi. The artimicrobial peptides are useful as individual antimicrobial agents, agents that enhance, potentiate and fungi. The antimicrobials, agents that enhance the antimicrobial antimicrobials, agents that enhance the antimicrobial or conventions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short and broad spectrum activity against pathogens exhibiting multiple antibiotic are based upon natural antimicrobial peptides that have potent and concerned problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradarion, retaining activity in plasma and overcome problems of toxicity, immunogenicity, in plasma and overcome problems of toxicity, immunogenicity, in plasma and coerum. The present mammalian cell toxicities and eventual antimicrobial peptides that have gotent and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradarion, retaining activity in plasma and overcome problems of toxicity, immunogenicity, and shortness of duration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of elukocytes against organisms such as bacteria and fungi. The antimicrobial peptides are useful as individual antimicrobial agents, specifically against bacteria and fungi, agents in combination with other antimicrobials, agents that enhance, potentiate or restore efficiacy of conventional antimicrobials, agents that enhance the antimicrobial tructions of leukocytes, as disinfectants or preservatives for use in thustions of leukocytes, as disinfectants or preservatives for use in combination with other conventions of leukocytes, as disinfectants of preservatives for use in the considered to have undesirable toxicity, immunogenicity and short been considered to have undesirable toxicity, immunogenicity and short considered to have undesirable toxicity, immunogenicity and short sectivity against pathogens exhibiting multiple antibiocic resistance. They exhibit lower inherent mammalian cell toxicities and expective present sequence is a rabbit pMP based antimicrobial peptide serum. The present sequence is a rabbit PMP based antimicrobial peptide

                        activity or for potentiating antimicrobial agents active against conganisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBRXB and its derivatives selected from XZBBZBRXBB, BXZXB, BXZXZB, XBBXZXBBX and its derivatives as escond peptide template XBBXZXB, XBBXZXBBX and BBXZBBXZ; and (b) a second peptide template XBBXZXB, XBBXZXBBX and elected from the group consisting of XBBXBBX, XBBXZBBX, BXXBXSB, XBBZXXBB, where B = at least one positively charged amino acid; X = at least one aromatic amino acid; and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of
present invention describes an antimicrobial peptide (AP) for direct
                                                                                                                                                                                                                                                                                                                                                                                                                                          neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAY57463 to AAY57557 represent sequences used in the exemplification of the present invention

The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBXB and its derivatives

against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acids containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity

The invention relates to an antimicrobial peptide composition for use

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acids containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial activity of
selected from XZBBZBXBXB, BXZXB, REAZXZBBX and BBXZBBXZ; and (b) as second peptide template XBBXX and their derivatives selected from the group consisting of XBBXXBBX, XBBXXBBX, XBBXXBBX, XBBXXBBX, and XBBZXXBBX, and XBBZXXBBX; where B = at least one positively charged amino acid; x = at least one non-polar hydrophobic amino acid; Z = at least one aromatic amino acid, and where B, X and Z amy be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of appoptosis of microbial cells. ANYS7463 to AAVS7557 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.

leukocytes against organisms such as bacteria and fungi. The antimicrobial peptides are useful as individual antimicrobial agents, specifically against bacteria and fungi, agents in combination with other antimicrobials, agents that enhance, potentiate or restore efficacy of conventional antimicrobials, agents that enhance the antimicrobial foods and cosmetics and as agents to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is that of Protide-3 (PT-3), a peptide antibiotide with distinct effector and activator domains. PT-3 contains a C-terminal antimicrobial peptide effector (RP-1), an N-terminal chemokine-like peptide effector (interlukin-8 domain) and an activator site specific for thrombin. PT-3 was designed to be cleaved into 2 distinct effectors in the presence of thrombin. In particular, it was designed to exert antimicrobial activity less than that of RP-1 in the absence of thrombin,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New context-activated protide, useful for vascular injury, neoplastic condition, microbial infection, decreased cell death or inflammatory condition.
                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                          ;

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBXB and its derivatives selected from XZBBZBXBXB, BXZXXB, XBBXZXBB, and (B) a second peptide template XBBXXXBX, BXBXXBB, and ESTBBXZBBX, and their derivatives selected from the group consisting of XBBXBBX, XBBXXBB, BXXBXXB, XBBXXBB, and XBBZXXBBX, where B = at least one positively charged amino acid; X = at least one non-polar hydrophobic amino acid; Z = at least one aromatic amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of meutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AX757463 to AAX5757 represent sequences cused in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                        ö
but equivalent to or exceeding that of RP-1 in the presence of thrombin. Thus, PT-3 exerts optimal antimicrobial activity in the context of thrombin as would be present in the setting of vascular injury or infection. PT-3 is an example of context-activated protides of the invention that have 2 or more effectors with individual distinct biological functions and one or more corresponding activator sites that can each initiate or amplify the biological function of one or more effectors upon context activation. The protides are useful in the diagnosis, prophylaxis and therapy of a broad range of pathological conditions.
                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antimicrobial peptides for potentiating antimicrobial agents active

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acide containing a 7-13 amino acide core sequence (derived from PMP-1 and PMP-2, platelet microbiolal protein), and retromers, PMP-1 and PMP-2, platelet microbiolal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial agents active against organisms such as or for potentiating antimicrobial agents active against organisms such as core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial apptides for potentiating antimicrobial activity of antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents, agents that enhance, potentiate or restore efficacy of conventional antimicrobials, agents that enhance the antimicrobial activity of tunctions of leukocytes, as disinfectants or preservatives for use in thoology techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short that based upon natural antimicrobial peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad

Compsns. for treating infections sensitive to beta-lactam antibiotics - comprise beta-lactam antibiotic and cationic oligopeptide, useful against Enterobacteriaceae, Pseudomonas aeruginosa etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This is a specific example of a cationic oligopeptide suitable for use in compositions with beta-lactam antibiotics. The peptide has an alpha-helical structure and is believed to act as an ionophore, making holes in bacterial cell membranes. The peptide and antibiotic act synergistically.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This is a specific example of a cationic oligopeptide suitable for use in compositions with beta-lactam antibiotics. The peptide has an alphablical structure and is believed to act as an ionophore, making holes in bacterial cell membranes. The peptide and antibiotic act synergistically. See AAR13924-R13929 and AAR13936-7. (Updated on 25-WAR-2003 to correct PA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Compsns. for treating infections sensitive to beta-lactam antibiotics - comprise beta-lactam antibiotic and cationic oligopeptide, useful against Enterobacteriaceae, Pseudomonas aeruginosa etc.
spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide

                                                                                                                                                                                                         microbial, anti-viral and anti-tumour activity. They are also useful for inhibiting, preventing or destroying the motility of sperm and hence have application in a spermicide preparation. They also have anti-parasitic activity and are useful in wound healing, as preservatives and sterilants and to inhibit growth of phytopathogenic microorganisms. AAR20969 and AR20970 were published in Haighten and Ostreah, Bio Chromatography, Vol 2, issue 2, page 80-83, 1987. (Updated on 09-ANN-2003 to and missing OS field.) (Updated on 25-MAR-2003 to correct PR field.) (Updated on 25-MAR-
                                                                                                                                Method for inhibiting target cell and virus growth - comprises administering amphiphilic peptide compsns, useful for treating viral and phytopathogenic infections, tumours and burns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   NO:20

```
The invention relates to a polypeptide comprising at least one protesseresistant or protesse-sensitive sequence, bound to the C-terminal side of the target polypeptide. The polypeptides are useful as antimicrobial agents against Ceratocystis fimbriata, which causes purple blotch in sweet potatoes, or Becherichia coli. They are also used in gene therapy. The present sequence is rabbit rCAP24 peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polypeptide comprising at least one protease-resistant or protease-sensitive sequence, bound to the C-terminal side of the target polypeptide, useful as antimicrobial agent against Ceratocystis
                                                                                                                                                                                                         Antimicrobial; purple blotch; gene therapy; antibacterial; fungicide; rabbit; rCAP24.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Muramoto N, Imaeda T, Hirai M, Shimamura T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example 11; Page 49; 50pp; English.

(I) have antibiotic, antimicrobial and antiviral activities, and can be used as microbial growth and proliferation inhibitors and in gene therapy. (I) are useful for inhibiting microbial growth in an environment capable of sustaining such growth, for inhibiting microbial growth or strain in a host, and inhibiting the growth of drug-resistant microbial strains such as Pseudomonas aeruginosa, Burkholderia cepacia, Alcaligenes and Xanthomonas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Lupine RCAP 18 cathelicidin derived antimicrobial peptide SEQ ID NO:21.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antimicrobial peptides useful as antibiotics for inhibiting growth and proliferation of microbes, and for treating microbial infections.
                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ovine; SMAP29; lupine; RCAP 18; cathelicidin; antimicrobial; bactericidal; antibiotic; antiviral; microbial growth inhibitor; prolliferation inhibitor; gene therapy; Pseudomonas aeruginosa; Burkholderia cepacia; Alcaligenes; Xanthomonas.

                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                            The invention relates to a novel polypeptide composition for preventing disease in an organism which comprises one or more types of polypeptide which have an alpha-helix structure and/or thionine component. The composition of the invention demonstrates antibacterial and antifungal activities and may be useful for preventing a disease in an organism, for generating cultivated plants and in providing resistance to plant tissue against fungi such as Pyticularia oryzae (rice blast fungus), Ceratorystis fimbriata and bacteria such as Pseudomonas etc. The composition has high antimicrobial activity at low concentration. The current sequence is that of the rabbit CAPIS peptide fragment of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antimicrobial polypeptide composition for a plant pathogen, comprises one or more types of thionine and/or a polypeptide having an alpha helix structure, as an active ingredient.

The polypeptides are useful as antimicrobial agents against Ceratocystis fimbriate, which causes purple blotch in sweet potatoes, or Escherichia coli. They are also used in gene therapy. The present sequence is a modified peptide based upon CAP18 derived from rabbit. This sequence is used in the exemplification of the invention
The invention relates to a novel polypeptide composition for preventing disease in an organism which comprises one or more types of polypeptide which have an alpha-helix structure and/or thionine component. The composition of the invention demonstrates antibacterial and antifungal activities and may be useful for preventing a disease in an organism, for generating cultivated plants and in providing resistance to plant tissue against fungi such as Pyricularia oryzae (rice blast fungus), Ceratocystis finbriate and bacteria anch as Pseudomonas etc. The composition has high antimicrobial activity at low concentration. The

The invention relates to a polypeptide comprising at least one protease-
resistant or protease-sensitive sequence, bound to the C-terminal side of
the target polypeptide. The polypeptides are useful as antimicrobial
agents against Ceratocystis fimbriata, which causes purple blotch in
sweet potatoes, or Escherichia coli. They are also used in gene therapy.
The present sequence is a modified peptide based upon CAP18 derived from
rabbit. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                        New polypeptide comprising at least one protease-resistant or protease-sensitive sequence, bound to the C-terminal side of the target polypeptide, useful as antimicrobial agent against Ceratocystis fimbriata, or Escherichia coli.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antimicrobial; purple blotch; gene therapy; antibacterial; fungicide; rabbit; rCAP24; CAP18.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a polypéptide comprising at least one protease-resistent or protease-sensitive sequence, bound to the C-terminal side of the target polypeptide. The polypeptides are useful as antimicrobial agents against Ceratocystis fimbriata, which causes purple blotch in sweet potatoces, or Escherichia coll. They are also used in gene therapy. The present sequence is a modified poptide based upon CAP18 derived from rabbit. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polypeptide comprising at least one protease-resistant or protease-sensitive sequence, bound to the C-terminal side of the target polypeptide, useful as antimicrobial agent against Ceratocystis fimbriata, or Escherichia coli.
                                                                                                                                                                                                                                          Antimicrobial; purple blotch; gene therapy; antibacterial; fungicide; rabbit; rCAP24; CAP18.

The invention relates to a polypeptide comprising at least one protease-resistant or protease-sensitive sequence, bound to the C-terminal side of the target polypeptide. The polypeptides are useful as antimicrobial agents against Ceratocystis fimbriata, which causes purple blotch in sweet potacoes, or Escherichia coli. They are also used in gene therapy. The present sequence is a modified peptide based upon CAP18 derived from rabbit. This sequence is used in the exemplification of the invention
                                                                                                                                             New polypeptide comprising at least one protesse-resistant or protesse-sensitive sequence, bound to the C-terminal side of the target polypeptide, useful as antimicrobial agent against Ceratocystis fimbriata, or Escherichia coli.

                                                                                                                                                                                           ö
                                                                                                                                                                                             Gaps
ORGANISM: Artificial Sequence
FEATURE:
COTHER INFORMATION: Antimicrobiocidal peptide designed in part upon
OTHER INFORMATION: microbiocidal domains from platelet microbial
COTHER INFORMATION: proteins 1 and 2 (PMP-1 and PMP-2) from rabbits
US-09-525-269A-8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    5; Indels
                                         Sequence 2, Application US/08760903
Patent No. 599381
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: FIRCA, JOSEPH R.
APPLICANT: ANDERSON, BYRON
TITLE OF INVENTION: COMPOUNDS THAT BIND BACTERIAL PILLI
NUMBER OF SEQUENCES: 9
CORRESPONDENCE ADDRESS:
ADDRESSEE: MEDLEN & CARROLL, LLP
STREET: 220 MONTGOMERY STREET, SUITE 2200
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      APPLICANT: WILLIAMS, JAMES A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           May be a C-terminal amide, and/or may
be acetylated at N-terminus, Xaa is
Met or methionine sulfoxide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 46, Application US/07725331

Patent No. 5294605

GENERAL INFORMATION:
APPLICANT: Houghten, Richard
APPLICANT: Blondelle, Sylvie
TITLE OF INVENTION: Amphiphilic Peptide Compositions and
TITLE OF INVENTION: Analogues Thereof
NUMBER OF SEQUENCES: 68

CORRESPONDENCE ADDRESS:
ADDRESSEE: Dressler, Goldsmith, Sutker, Shore,
ADDRESSEE: Dressler, Goldsmith, Sutker, Shore,

TITLE OF INVENTION: NOVEL ANTIVIRAL ACTIVITIES OF PRIMATE THETA DEFENSINS AND MAMMALIA.
TITLE OF INVENTION: CATHELLICIDINS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 15, Application US/10344709C

Sequence 15, Application US/2040170642A1

Sequence 16, Application US/2040170642A1

GENERAL INFORMATION:

TITLE OF INVENTION: Vaccine which comprises at least one antigen and a cathelicidin TITLE OF INVENTION: derived antimicrobial peptide or a derivative thereof

TITLE OF INVENTION: Gerived antimicrobial peptide or a derivative thereof

TITLE OF INVENTION: derived antimicrobial peptide or a derivative thereof

TITLE OF INVENTION: derived antimicrobial peptide or a derivative thereof
